# Lev-Ari (2017)

Lev-Ari, S. (2017). Talking to fewer people leads to having more malleable linguistic representations. *PLoS ONE*, 12, e0183593.

Perceptual learning experiment run on MTurk

- Do people with smaller social networks have more malleable linguistic representations (as assessed through a perceptual learning experiment)?

**Shiri Lev-Ari**  
(Royal Holloway,  
University of  
London)

# Social network effect on new speakers only?

# Social network effect on new speakers only?

Big social network,  
little effect of training

Small social network,  
big effect of training

# Raw data

Same speaker

New speaker

# Alternative analyses

From supplementary materials

“1. Analyses that do not exclude the participants whose Social Network Size was 4 and 8 standard deviations from the mean show very different results from those reported in the paper. Comparing results with and without a particular participant or observation is in fact the test for undue influence, often called Cook’s Distance [1]. Analyses whose results depend on including a specific data point or individual are considered unreliable.

2. Analyzing the data with the untrimmed estimates of Social Network Size leads to the same pattern of results as in the analysis reported in the paper, but the triple interaction does not reach conventional level of significance ( $\beta=0.13263$ ,  $SE=0.07405$ ,  $z=1.791$ ,  $p=0.073$ ).”

# Lev-Ari's conclusions

Individuals with smaller social networks have more malleable linguistic representations

- More influenced by manipulated-/d/ training
- Potential role for such individuals in propagating linguistic change?
